"Determination of Liver Perfusion with Colloidial Iodo Isotope,"

Biophysz. Orvosi Szemle, Vol 101, no 1, 18 Apr 63, pages 32-39.

Abstract (Author's Hungarian summary) The liver perfusion determined with colloidial Au198 is a valuable addition to the current experimental techniques. The test is easy on the patient, can be carried out simultaneously, and the degree of the liver circulation can be checked frequently. In the course of the experiments the minimal liver circulation value in normal individuals was 660-112 ml/min/l, in patients with chronic hepatitis and cirrhosis it was 360-390 and 215-250 ml/min/l respectively. The test is considered to be of prognostic value and is also useful for the determination of the effectiveness of the treatment. (Seeum references).

"Analysis of the Mode of Action of Reserpine"

Budapest, A Magyar Tudomanyos Akademia V. Orvosi Tudomanyok Osztalyanak  
Kozlemenyei, Vol XVI, No 2-3, 1965, pages 227-238.

Abstract: [Authors' Hungarian summary modified] The differences in pharmacological effect achieved with a single dose of 3 mg/kg of reserpine and with the prolonged administration of the same dose at a rate of 0.1 mg/kg/day was studied in rats. It was characteristic of the acute treatment that the tranquilizing effect and the motility-decreasing effect could be antagonized with amphetamine and DOPA. In that case, the pyrogenic effect of amphetamine on rats was inhibited and the noradrenalin sensitivity of cats was not affected. In the state of central nervous system depression caused by prolonged reserpine treatment, the pyrogenic effect of amphetamine was enhanced in rats. The noradrenalin sensitivity of cats was also greatly enhanced under such conditions. The sensitivity to electroshock and pentametazole spasms is increased both by acute and prolonged reserpine treatment of the animals and nor is there any significant difference in the noradrenalin content of the brain tissue in the

Kozlemenyei, Vol XVI, No 2-3, 1965, pages 227-238

two cases. An analysis of the experimental results led to the hypothesis that in the course of prolonged reserpine treatment a specific "chemical denervation" occurs in the central nervous system and at the periphery which is accompanied by a state of denervational supersensitivity and is responsible for the effects observed. This mode of action is thought to make reserpine more valuable in human therapy. This state cannot be produced by means of acute reserpine treatment or by the acute or prolonged administration of benzoquinolizine derivatives (e.g. tetrabenazine) which have a biochemical effect similar to that of reserpine. Some pharmacological properties of tetrabenazine were analyzed in detail. 8 Hungarian, 30 Western references. Manuscript received

"Inhibition of the I<sup>131</sup> Uptake by the Thyroid with D-Thyroxine in Hyperthyroid and Euthyroid Subjects"

Budapest, Orvosi Hetilap. Vol 107, No 11, 13 Mar 66, pages 499-500

Abstract: [Authors' Hungarian summary] The measurement of I<sup>131</sup> uptake by the thyroid is reported, following the administration of D-thyroxine for 3 days, in 10 hyperthyroid subjects and in 12 subjects with a high I<sup>131</sup> uptake who were clinically classified as euthyroid. In the hyperthyroid group, the radioactive uptake did not change in response to D-thyroxine administration while in the euthyroid subjects there was a 50 per cent decrease in uptake in comparison with the previous value. All 7 references are Western.

"The Clinical Value of Renography."

Budapest, Orvosi Hetilap, Vol 108, No 10, 1 Mar 67, pages 447-452.

Abstract: [Authors' Hungarian summary] On the basis of 160 cases, renography is considered to be a valuable method in the diagnosis of renal diseases. It is primarily suited for the differentiation of unilateral renal diseases. It is primarily suited for the differentiation of unilateral renal diseases. It is simple to perform, especially in children, is non-painful and is well reproducible. Without any pre-triangular examination, the following information can be obtained with renography: a) kidney function on either side separately, b) the intensity of the arterial blood flow and c) the renal blood supply to kidneys, the latter being the most important.

"A Surgically Corrected Case of Hypertension Caused by Fibromuscular Hyperplasia of the Renal Artery."

Budapest, Orvosi Hetilap, Vol 108, No 10, 5 Mar 67, pages 464-466.

Abstract: The case of an 18 year old patient is described. Although the usual clinical examinations furnished no indication of a possible renovascular origin of the hypertension, the age of the patient led to further studies culminating in the correct diagnosis and rehabilitation of the patient. The problems involved in similar cases are discussed and some diagnostic guide lines are presented in the article. 3 Hungarian, 15 Western references.

27. Determination of the silicic acid and calcium content of cryolite and other compounds containing fluorine by spectrum analysis - M. Máriassy, V. Borsutzky and L. Somogyi. (*Kohászati Lapok* Vol. 9 (87), 1954, No. 5, pp. 267 - 270, 6 figs.)

Two methods have been elaborated for determining the  $\text{SiO}_2$  content of materials with a high fluorine content by spectrum analysis. (1) Determination by means of a "fulgurator" using a solution obtained after digestion. One g of material is digested with an eightfold amount of soda, the melt is elutriated with water and topped to 250 ml. Analysis is effected with a "fulgurator", spectrally pure carbon is used as a counterelectrode. Inner standard is Cr (a solution of  $\text{K}_2\text{CrO}_4$ , condenser capacity 6000 cm, self-induction 0.8 mh. Advance sparking 30 sec, exposure 80 sec. Pairs of lines for evaluation: Si 2881.6/Na 3302.3 - Si 2881.6/Cr).

Attachment of the electrode to the gun barrel  
is done by the following method:  
The gun barrel is cleaned with acetone and dried.  
A thin layer of graphite powder is applied to the  
inside of the gun barrel. A thin wire is wound  
around the gun barrel and the wire is used as a  
carrier for the electrode. The carrier is wound  
over the gun barrel 30 sec., exposure 90 sec.  
Excitation voltage is 220 v., current 20 mA. Si 28.1/Na 2302.3-  
Si 28.1/Na 2302.3. The method is a powder analysis  
with a rotary electrode. This method, by Fainly-  
cov (ref. No. 45, 1957), uses a rotary electrode. The  
latter, as well as the counter electrode, are made of elec-  
trolytic Cu. The material to be analyzed should be pulver-  
ized. Pairs of lines for evaluation are Si 28.1/Fe 2170.5-  
Si 28.1/Na 2302.3. Advance sparking is 60 sec. for  
60-sec. exposure. The electrode speed is 60 r.p.m. The  
rotary electrode method can also be used for the detn. of  
Ca. The speed is 60 r.p.m. with a primary voltage of 220 v.,  
advance sparking 60 sec., exposure 15 sec. Pairs of lines  
for evaluation are Ca 3583.87/Na 2302.3. K. L. C.

## EXCERPTA MEDICA Sec 2 Vol 12/9 Physiology Sept 59

4319. RECENT INVESTIGATIONS ON RECIPROCAL ACTIONS OF THE RETICULAR FORMATION AND THE CORTEX - Neuere Untersuchungen über die Wechselwirkungen zwischen der Formatio reticularis und der Cortex - Somogyi L., Porszász J. and Takács O. Neurol.-Psychiat. Klin. und Physiol. Inst., Med. Univ., Szeged - ACTA PHYSIOL. ACAD. SCI. HUNG. 1958, 14/4 suppl. 1958 (34-35)

These reciprocal actions were studied by stimulation of the mesencephalic reticular formation, lateral hypothalamus, anterior ventral thalamus and central cut end of the sciatic nerve in 32 cats. Electrical activity of the cortex was recorded electroencephalographically and that of the reticular, hypothalamic and thalamic regions contralateral to those stimulated was recorded with depth electrodes. The desynchronization that followed stimulation of the diffuse activating system was either abolished or reversed (hyperasynchronization; inhibition) by barbiturates in various dosages. The inhibitory effects of barbiturates at both cortical and subcortical levels were abolished by ether anaesthesia. The 'activating' effect of ether was still more convincing in the experiments with sciatic nerve stimulation. The afferent impulses running from the ascending reticular system to the cortex activate a mechanism which inhibits the subcortex. This inhibitory mechanism is eliminated by ether. The physiological significance of this cortico-subcortical inhibitory mechanism is that the cortex can protect itself against excessive stimuli according to the principle of 'negative feed-back'

"Frequency Reactometer" - New Method and Device for Measuring the Time for Response"

Budapest, Magyar Psichológiai Szemle, Vol 19, No 4, 1964, pp. 420-425

Abstract (Author's English summary modified): Authors expound the usual principles governing the measuring of the time for response and the demands which they have to meet in order to satisfy: (1) inexpensive operation; (2) unequivocal determination of the time measured; (3) completeness as far as possible; (4) simplicity. Authors took duly into account above-said requirements when designing and assembling their new device, the frequency reactometer, in the laboratory of the Institute. The paper presents the description of the new device.

"Experiences With the Use of Reparil in the Treatment of Patients With Skull Injury."

Budapest, Magyar Traumatologia, Orthopaedia et Molyreallito Sebeszet, Vol X, No 1, Feb 67, pages 35-43.

Abstract: [Authors' English summary modified] The results of Reparil (Dr. Madaus Co., Köln) therapy given to 40 patients with skull injury are reported. In the opinion of the authors, Reparil has an elective cerebral effect. The compound has a favorable effect both on the disturbance in consciousness and on the subjective symptoms. Two cases are presented in which Reparil therapy was used with success in the treatment of cerebral embolism following cardiac catheterization. 2 Hungarian, 11 Western references.

The effect of small doses of copper upon erythropoiesis.  
James Somogyi. Magyar Orvost. Akad. 30, 317 (1935).  
A single intravenous injection of  $CuSO_4$  (0.3-0.6 mg. of Cu per kg.) into rabbits increases erythropoiesis. The number of red cells rises 16-39.2% and the hemoglobin rises 24-47% above the normal. The increase is maintained for 18 days. In hemorrhagic anemia copper hastens regeneration of blood. Numerous references are given.

**Role of the sympathetic nervous system in blood regeneration.** J. C. Somogyi (*Magyar Orv. Arch.*, 1939, 60, 186-203).—Ergotamine (0.2 mg. per kg. daily) inhibited blood regeneration after hemorrhage in cats. Partial sympathectomy caused a decrease of red corpuscles and haemoglobin, and an increase of leucocytes. Cervical sympathetic stimulation increased the red corpuscles and the haemoglobin, the latter effect disappearing when stimulation followed thyroidectomy. " A. W. M.

SOURCE: Biologia, no. 11, 1965, 887-889

TOPIC TAGS: neuron, cell physiology, dog, cardiovascular system, tissue physiology

ABSTRACT: In experiments using dogs it was found that animals with experimentally induced heart hypertrophy show a significant increase of intramural gangliar cells and their nuclei. This is an adaptation change which results in the maintaining of the original ratio and the renewal of the equilibrium between the size of the nerve cells and the extent of the innervated zone. E. Stojanova participated in the technical work. Orig. art. has: 1 figure. [JPRS]

TITLE: Distribution of the altitude errors in spatial aerial triangulation with dual photograph series

SOURCE: Geodezia es kartografia, no. 2, 1966, 95-98

TOPIC TAGS: triangulation, photograph, error minimization

ABSTRACT: The method for single photograph series described by the authors Ibid., 1966, No 1 [page numbers not given] was extended to operations involving dual photograph series. The simplification of the computations by the new method is evident if it is realized that with dual photograph series the juncture points will fall in the overlap zones of four adjacent models and that the juncture points used are those employed for error distribution in the horizontal sense. Thus, it is possible to obtain the constants of the unknowns from the horizontal planar error distribution. Eleven equations were presented. Orig. art. has: 11 formulas and 2 tables.

Sp. Investigations on the surface hardness of concrete  
- Viszsgálatok a beton felsőréteg kényszerűségről - K. Somogyi.  
(Scientific Review of Civil Engineering -  
Műszaki Szemle - Vol. II, No. 5, May 1953, pp. 249-  
253, 6 figs.)

A continuous and well defined relation exists between  
the cube strength and surface hardness of concrete on the  
basis of which the index of the latter may furnish charac-  
teristic data in respect to the quality of the concrete. The  
method of measuring surface hardness developed by the  
author as well as the apparatus designed by him are  
based on Soviet experiences. A rotating tapered needle  
of determined size and material penetrates under a given  
pressure into the mortar on the surface of the concrete  
sample. The penetration readings may be taken with an  
accuracy of 0.01 mm. The result of the tests carried out  
on concrete samples of varying age, mix, method of com-  
pacting and curing can be expressed by the following

formula :  $\sigma_s = \frac{b}{\sqrt{a}}$ , where  $\sigma_s$  denotes the cube strength  
in kg per sq mm,  $b$  the depth of penetration of the needle  
in mm,  $a$  a factor depending on the type and grading  
of the aggregate and the method of compacting. Compar-  
ative measurements of surface hardness and cube strength,  
carried out on different types of concrete, indicated the  
factor to be 0.43 on the average. The same tests showed  
further that the relation between cube strength and sur-  
face hardness is defined by the constant 0.776. K. Somogyi

The barrier film produced by oxidation of Al. István  
Kósa Somogyi (Magyar Tud. Akadémia Központi Fizikai  
Kutató Intézete, Budapest, Hung). Magyar Kém. Folyóirat  
66, 51-5 (1960).—Al plates 99.90% pure were oxidized in  
10% H<sub>2</sub>SO<sub>4</sub> soln. with internal cooling. The thicknesses of  
barrier films were detd. in NH<sub>4</sub> tartrate solns. at pH 5.5  
by capacitance measurements. Anodic potential depends  
on the thickness of the barrier film. On oxida. with H<sub>2</sub>SO<sub>4</sub>  
a unit voltage drop is brought about by oxide film 10-12 Å.  
thick. Film thickness depends on the ratio of oxide film  
growth and soln. velocity. The microstructure of the film  
depends primarily on the applied e.d., as demonstrated by  
J. Csávár.
